**Session evaluations**

Your feedback is important and valuable.

Submit by 5pm Friday, November 16th to win prizes.

3 Ways to Access:

-  **Go to [passSummit.com](http://passSummit.com)**
-  **Download the GuideBook App** and search: PASS Summit 2018
-  **Follow the QR code link** displayed on session signage throughout the conference venue and in the program guide

**Agenda**

- Problem domain
- Introduction to Biml
- Creating a solution with SSIS and Biml
- Demo

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

The Problem Domain

The challenges of enterprise ETL

- Numerous sources, destinations
- Legacy processes
- Limited documentation
- Undefined or unknown dependencies

---

---

---

---

---

---

---

---

The Problem Domain

The challenges of enterprise ETL

- Multiple copies of the same logic in various locations
- Upstream data changes could require significant manual updates

---

---

---

---

---

---

---

---

### The Problem Domain

The challenges of enterprise ETL

- Data type oddities
- Mappings and transformations buried in code may not be easily changed (or even understood) by data stewards

---

---

---

---

---

---

---

---

### The Problem Domain

Metadata management is rare

- Metadata is often considered an obstacle rather than an asset
- Good metadata management is as important as good ETL logic management

---

---

---

---

---

---

---

---

### The Problem Domain

Metadata management requires work

- More significant time investment than ad-hoc ETL process development
- For simple or very slowly changing data pipelines, formal metadata management may take a long time to pay off
- Not ideal for every organization or workload

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

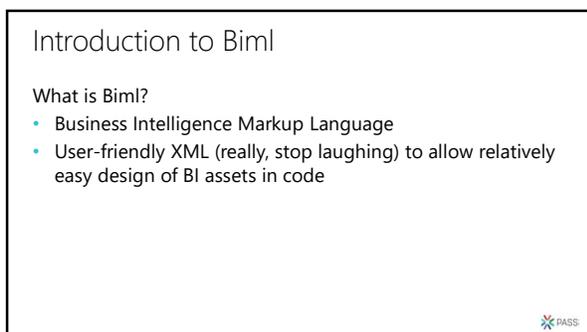

---

---

---

---

---

---

---

---

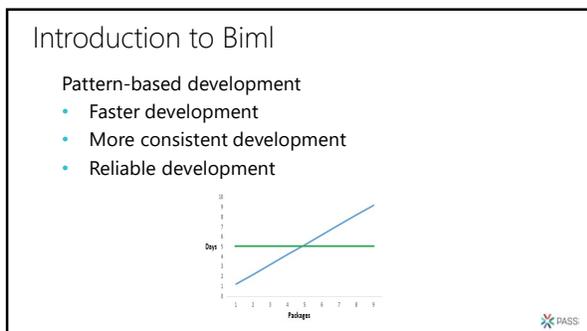

---

---

---

---

---

### Introduction to Biml

Pattern-based development

- Supports atomic package design \*
- Creating many packages requires little if any extra effort

\* ETL Best Practices: Atomicity <https://www.timitchell.net/post/etl-atomicity>

---

---

---

---

---

---

---

---

### Introduction to Biml

Ideal use cases for Biml

- Simple staging
- Rapidly changing metadata
- Large number of similar packages
- Template engine
- Generating packages based on predefined mappings \*

---

---

---

---

---

---

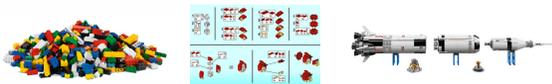

---

---

### Introduction to Biml

Ideal use cases for Biml

- Logical, repeatable patterns
- Repetition and patterns are predictable and scriptable

---

---

---

---

---

---

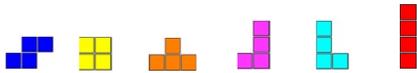

---

---

### Introduction to Biml

#### Ideal use cases for Biml

- Dissimilar output packages are expected, as long as the build logic is similar enough to be automated

---

---

---

---

---

---

---

---

### Introduction to Biml

#### Ideal use cases for Biml

- Dissimilar patterns or unpredictable logic may not be a good fit

---

---

---

---

---

---

---

---

### Introduction to Biml

#### Biml tools

- Biml Express (free)
- Biml Studio

---

---

---

---

---

---

---

---

## Introduction to Biml

### The Biml language

```
<Packages>  
  <Package Name="BimlPackage">  
    <Tasks>  
      <Dataflow Name="DFT Orders">  
        ...  
      </Dataflow>  
    </Tasks>  
  </Package>  
</Packages>
```

---

---

---

---

---

---

---

---

## Introduction to Biml

### The Biml language

```
<Biml xmlns="http://schemas.varigence.com/biml.xsd">  
  <Connections>  
    <OLEDBConnection Name="AdventureWorks" ConnectionStrings="Provider=SQLNCLI10;Data Source=localhost..." />  
  </Connections>  
  <Packages>  
    <Package Name="DemoPackage" ConstraintMode="Parallel">  
      <Tasks>  
        <ExecuteSQL Name="SQL - Truncate Table" ConnectionName="AdventureWorks">  
          <DirectInput>TRUNCATE TABLE [Sales].[Store]/DirectInput</DirectInput>  
        </ExecuteSQL>  
      </Tasks>  
    </Package>  
  </Packages>  
</Biml>
```

---

---

---

---

---

---

---

---

## Introduction to Biml

### Essential moving parts

- Package
  - Central component of Biml development
  - All native tasks and components are supported
  - Data flow components

---

---

---

---

---

---

---

---

### Introduction to Biml

#### Essential moving parts

- Connections
  - Defined independently
  - Used across multiple packages
  - Project\* or package connections

---

---

---

---

---

---

---

---

### Introduction to Biml

#### Essential moving parts

- Supporting items
- Parameters
- Configurations
- Logging

---

---

---

---

---

---

---

---

### Introduction to Biml

#### BimlScript

- Static Biml on its own won't add that much value
- Automating using BimlScript allows for unlimited dynamic behavior

---

---

---

---

---

---

---

---

### Introduction to Biml

#### What is BimlScript?

- Biml + .NET scripting
- Create dozens or even hundreds of objects with a minimum amount of code
- As simple or complex as needed

---

---

---

---

---

---

---

---

### Introduction to Biml

#### What is BimlScript?

- Any .NET behavior can be used
- Database connections
- File system operations
- Machine or network information
- Loops
- Wait conditions

---

---

---

---

---

---

---

---

### Introduction to Biml

#### What is BimlScript?

- C# or VB.NET
- C# is default

---

---

---

---

---

---

---

---

## Introduction to Biml

### BimlScript Syntax

- <# Code Block #>  
Any .NET Code
- <#- Inline Code Block #>  
Calls the .NET ToString() method on the expression
- <#@ Directive #>  
Set configuration options
- <#+ Module Level Code Block #>  
Functions that are callable from within code block

---

---

---

---

---

---

---

---

## Introduction to Biml

### BimlScript Syntax

```
<#@ import namespace="System.IO" #>  
<# string directory = "C:\\Where\\Packages\\Are\\Located\\"; #>  
<Biml xmlns="http://schemas.varigence.com/biml.xsd">  
  <Packages>  
    <Package Name="Execute All Packages" ConstraintMode="Parallel">  
      <Tasks>  
        <# foreach (string filePath in Directory.GetFiles(directory, "*.dtsx") { #>  
          <ExecutePackage Name="Run Package - <#filePath#>">  
            <ExternalFile ExternalFilePath="<#filePath#>" />  
          </ExecutePackage>  
        <# } #>  
      </Tasks>  
    </Package>  
  </Packages>  
</Biml>
```

---

---

---

---

---

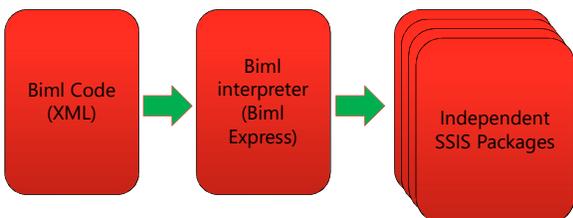

---

---

---

## Introduction to Biml

### Biml workflow

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

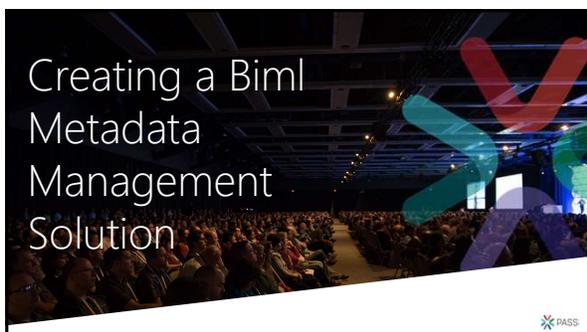

---

---

---

---

---

---

---

---

---

---

---

---

---

### Creating a Metadata Management Solution

SSIS + Biml = Metadata management

- Store and manage metadata definitions
- Codify business rules and cleansing logic

---

---

---

---

---

---

---

---

### Creating a Metadata Management Solution

Let the tools do what they do well!

- SSIS handles the ETL
- Biml builds the SSIS assets
- SQL Server stores the metadata definition and rules

---

---

---

---

---

---

---

---

### Creating a Metadata Management Solution

Key table entities

- DataSet: Any set of data (relational, flat file, web services)
- DataColumn: One of the columns in a data set
- Mapping: A process to link one source to one destination. One mapping will create one package
- Process: A collection of mappings. One process translates in to one project, which may have 1:n mappings
- Transformation: Reference list of transformations. May be written in C#, T-SQL, or SSIS expression language

---

---

---

---

---

---

---

---

## Creating a Metadata Management Solution

### Key table entities

- DataColumnMapping: Defines the columnar relationship between two DataSets. Granularity of Column.
- DataColumnMappingTransformation: A set of transformations for a single column-to-column mapping
- DataType: A list of data types and their environment-specific handles \*
